The *Wheat Situation* is published in February, May, August and November.

The 1976 winter wheat crop has been plagued by more weather uncertainty than usual and weather-related questions are likely to continue until the last bushel has been harvested. First there was the prolonged drought in the Southern Plains, then cold weather imperiled the maturing crop. Winter wheat production as of May 1 was estimated at around 1,460 million bushels, down 12 percent from last year's record harvest but still less of a decline than had been feared. Spring wheat acreage is expected to be up substantially and with good moisture in the Northern Plains, yields could be average or better. However, the 1976 crop is still expected to fall somewhat short of last year's record 2.1-billion-bushel crop. An expected increase in carryover would more than offset the decline in production, resulting in a total supply slightly in excess of 1975's 2.5 billion bushels.

Plantings and early season growing conditions point to a record large world wheat crop in 1976, suggesting that world import demand may be off from the 1975/76 level. This is reflected in the 1976/77 U.S. export estimate of 950-1,150 million bushels, compared with 1.2 billion this year. Domestic use may increase slightly in 1976/77, due to heavier wheat feeding. But projected total disappearance is well under the estimated crop, pointing to the third consecutive buildup in stocks. On balance, this would indicate that prices again would be under pressure and would average below this year's estimate of about \$3.50 per bushel.

Wheat prices at the farm hit a seasonal low of \$3.00 per bushel at harvesttime last summer. The large grain sales to the USSR then added strength to prices during July-September, but prices declined significantly over the October-December quarter. As the drought intensified, concern over the 1976 winter wheat crop pushed prices back up during January-March. But prices eased as April rains fell on the Plains and by mid-April farm prices averaged \$3.50 per bushel. Prospects for the second largest crop on record and another year of stock-building may result in some weakness in wheat prices as harvest approaches. Prices could decline 25-50 cents per bushel from the mid-April level as

the pressures from the 1976 harvest grow; on the other hand, adverse conditions in one or two major producing or importing countries could trigger a sharp increase in demand and reverse this trend.

A review of the 1975/76 crop year reveals a mixed disappearance bag. A recovery was expected in domestic food use of wheat, but the strength of mill grind has proved surprising. A record high is likely for exports but the level has still proved a disappointment since sales have tailed off sharply at season's end, necessitating a reduction in the export estimate to 1.2 billion bushels. The use of wheat as a feed has been limited this year by the uncompetitive relationship of wheat prices to feed prices. With total disappearance estimated at about 1.9 billion bushels, 200 million will be added to stocks pushing the July 1 carryover to approximately 550 million.

Hard Red Winter (HRW). Drought across the heart of the HRW wheat producing belt has dropped 1976 prospects below last year's record. As of May 1, it appears that this year's harvest could fall 150-200 million bushels below last year's 1,056 million. But with a build up in stocks anticipated, total supplies may not be much different from the

1975/76 level.

Soft Red Winter (SRW). Acreage seeded to SRW last fall continued large but growing conditions were marred by some freeze damage in Indiana and Ohio and dry weather in the Southeast. Consequently, the 1976 harvest may total no more than last year's bumper 342 million bushels.

Hard Red Spring (HRS). HRS producers indicated about 15 percent more planted acreage this spring. With average yields, the 1976 crop could total close to 400 million bushels, nearly 20 percent above last year. This points to substantially larger supplies in 1976/77.

Durum. A cutback in planting intentions for the traditional durum area of the Northern Plains is partially offset by an expansion in the Southwest, mainly Arizona. If yields are average the 1976 crop could fall in a range of 125-150 million bushels, pushing next year's supplies well above 1975/76's.

White Wheat. Although acreage seeded to white wheat is off from the 1975 level, good growing conditions could place the 1976 crop near last year's 285 million bushels. A larger carryover could result in total supplies around 1975/76's 315 million bushels.

OUTLOOK FOR 1976/77

Drought in the Plains Cuts Winter Wheat Crop Below Last Year's Record

The dry weather in the southern and central Great Plains that persisted from fall until mid-April has taken its toll on the 1976 winter wheat crop. The most seriously affected area included parts of Kansas, Colorado, Texas, Oklahoma, and New Mexico. The harvest for these five States based on May 1 conditions was estimated to be about 540 million bushels, down 5 percent from last December's estimate and about a fourth below 1975 output.

However, conditions in other winter wheat States have been generally good since planting and crop prospects are only a little below the 925 million bushels forecast last December. Thus, the indicated total winter wheat production of 1,459 million bushels is about 12 percent below last year's record.

Winter wheat producers seeded 57 million acres, 2 percent more than the preceding year. However, due to adverse weather during the growing season the rate of abandonment will be roughly double that of 1975.

The 1976 harvest began in early May and is running ahead of schedule. While yields in the Southern Plains are down this year, the quality of

the hard red winter (HRW) wheat crop may be substantially improved. Normally, there is a fairly high negative correlation between HRW yields and the protein content of the crop.

Larger Spring Wheat Acreage Indicated

According to April 1 planting intentions, wheat growers expect to seed about 21 million acres to spring wheat, 12 percent more than a year ago and 6 percent more than indicated on January 1. However, the story in the spring wheat belt is the reduction in planting intentions for durum wheat from January as well as from 1975.

It appears that recent reductions in durum prices have caused growers to shift their plans from durum to hard red spring wheat. Also, there may have been some shifting from earlier plans to seed oats, barley, flaxseed, and perhaps sunflowerseed. As a result, prospective acreage of other spring wheat was up 11 percent from January indications and 17 percent from last year.

Durum wheat has recently been introduced in the Southwest as will become particularly apparent in 1976. Since this wheat is all irrigated extremely high yields are expected. Much of it is contracted for export. Durum acreage in Arizona and New Mexico, which is reported for the first time in 1976,

totals 325,000 and 20,000 acres, respectively. While there was a significant area planted to durum in these States in 1975, much of the current estimated acreage represents expansion this year. However, durum growers in North Dakota, the leading State, expect to reduce plantings by 10 percent while acreage in South Dakota and Montana is also expected to be down sharply.

Seeding of spring wheat progressed well ahead of schedule throughout all major production areas. A combination of generally adequate moisture conditions, accompanied by extended periods of open weather allowed growers to finish field preparations and permitted expedient planting. While wet weather has plagued preparations in some areas of North Dakota, planting is still ahead of normal and as of May 9, over 80 percent of the crop in the four Northern Plains States had been planted compared to less than 20 percent last year and around 50 percent normally.

The larger acreage coupled with average yields could produce a spring wheat crop between 490 and 650 million bushels, compared to last year's 483 million.

Harvest Down But Increased Carryover To Swell Supplies

Winter wheat plantings and spring intentions indicate a total 1976 wheat acreage of 78.4 million acres, 4 percent above last year and the largest acreage since 1953. If weather is favorable across the wheat area, during the remainder of the growing season, yields per harvested acre could average around 29.5 bushels, down 6 percent from last year's level. Thus, the 1976 wheat crop may total between 1.95 and 2.1 billion bushels. While this would be down from last year's record, it still would be well above the previous second largest crop harvested in 1974.

With export commitments lagging badly in the last quarter of the current marketing year, it appears that old crop stocks on this July 1 will be up about two-thirds from last year's 327 million bushels. This expected increase in carryover of wheat into the 1976/77 marketing year would offset the expected shortfall in the 1976 wheat crop. The higher stocks coupled with the 1976 harvest should place the total wheat supply for 1976/77 at or above last year's 2.5 billion bushels. The question now becomes how this supply will be distributed during the course of the marketing year and what will be the level and direction of prices.

U.S. Exports likely To Continue Large But Down From 1975/76

Based on current information relative to spring wheat planting intentions and conditions of winter

wheat crops around the world, the 1976 world wheat crop is projected at 385 million metric tons, more than a tenth larger than last year. This larger global wheat crop would suggest that world import demand may be down in 1976/77. World wheat trade for 1976/77 (July-June) is projected to total 63 million tons, 4 million tons less than estimated for 1975/76. Based on these expectations U.S. wheat exports are projected between 950 and 1,150 million bushels, making it another strong export year although not a record.

Outstanding sales for 1976/77 delivery as of May 2 totaled 2.8 million metric tons compared with 4.4 million for the corresponding period a year ago. That the pace of commitments is down from a year ago and well below the frantic levels of 1974/75 suggests that foreign buyers have now settled on an even purchasing pattern, probably because of prospects for larger grain supplies. Also, trade agreements and understandings made during the course of the last year may have relieved buyer anxiety over the possibility of being shut off from our supplies. Thus, we expect to see commitments for 1976/77 follow the pattern of 1975/76 when they were made rather evenly during the course of the year. Major buyers for 1976/77 delivery thus far include the USSR, European Community, India, Israel, Egypt, and Brazil.

Domestic Demand May Be Up Moderately

Another large U.S. wheat supply would suggest that there may be some gains in wheat feeding, particularly if wheat prices follow their traditional pattern of being favorably priced relative to competing feed grains during the early harvest period. The continuing expansion in nearly all sectors of the feeding industry should benefit wheat use, but feeders can be more selective with a larger supply of nearly all feed concentrates. However, with the outlook for another large feed grain supply for

1976/77, it would seem that wheat feeding will increase only moderately from this year's estimated 85 million bushels.

Food use is likely to change only slightly after this season's jump, and seed use is projected near 1975/76 levels. Thus, total domestic use may range between 735-785 million bushels, up from this season's 720 million bushels.

Another Stock Buildup Possible in 1976/77

The projected level of total disappearance would fall well under projected production which would mean another buildup in stocks—the third in as many marketing years. On balance, this would indicate that prices again would be under pressure and would average below this year's estimate of about \$3.50 per bushel. New crop futures contracts indicate that harvesttime farm prices may be near \$3.00 a bushel while distant contracts reflect traditional carrying charges. But the experience of the past 4 years should indicate that markets need to be constantly appraised as the season progresses. Conditions to consider include:

(1) The world wheat crop. While prospects appear relatively favorable at this time, adverse conditions in one or two major producing or importing countries could trigger a sharp increase in demand. This has been the case for U.S. exporters in past years. Major buyers have shifted in and out of our markets; witness the Soviet Union in 1972/73, the People's Republic of China in 1973/74, India in 1974/75, and Brazil and the USSR in 1975/76. These extraordinary fluctuations have occurred while markets in other areas have remained firm or continued to grow.

(2) Feed grain supplies both in the United States and the world.

(3) World rice production. An often forgotten fact is that some of our exports to developing countries stem from poor rice crops, not poor wheat crops. In 1975/76 the world harvested its third consecutive

record rice crop. Rice supplies are relatively abundant and exporters are faced with the largest carryovers since 1971. But with demand pressures strong in this area, any setback in rice production could increase demand for wheat imports.

(4) Wheat holders' marketing plans. A great deal of discussion and rhetoric has been concerned with orderly marketing or an increase in demand for grain inventories. This has developed into buying or selling strategies such that certain price levels will trigger sales out of first hands. On the other hand, prices below certain levels will keep wheat in growers' hands as they wait until price objectives are reached. The demand for stocks has definitely shifted. For example, pipeline stocks have increased well above pre-1972/73 levels just to meet the increase in usage.

1977 Wheat Allotment Up A Fraction

The 1977 crop wheat allotment was announced at 62.2 million acres, 1 percent above this year's allotment and a 16-percent increase over 1975. The 1977 allotment will be divided among States, counties, and individual producers on the same general basis as for 1976.

The national allotment is calculated to be the number of harvested acres of wheat, given the estimated national yield, needed to produce enough wheat to meet both domestic and export demands (less imports). The 1977 allotment was based on a 32-bushel-per-acre national yield and total utilization (less imports) of 1,990 million bushels. Domestic use was projected to be 766 million bushels, exports 1,225 million bushels, and imports 1 million bushels.

The national wheat allotment is not intended to limit wheat acreage. Its purpose is to provide a basis for making disaster payments to qualifying farmers and deficiency payments when the market price of wheat falls below the established target price. These payments are made only on allotment production.

THE 1975/76 SITUATION

Wheat Use Heavy

Wheat disappearance during July-March of over 1.5 billion bushels was the second heaviest on record for that period. Both the domestic and export sectors have strengthened from last year's levels.

Domestic food use during July-March was running about 10 percent ahead of a year ago's pace. Part of the increase is simply a recovery from last season's depressed level of mill grind. Last year food use was limited by consumer resistance to

high prices of bakery products resulting from the high cost of flour, sweeteners and shortening. An apparent drawdown in flour inventories also was a limiting factor. Even after taking this into account, the strength of this year's recovery is somewhat mystifying. Several factors may be contributing to the surge. Lower prices for wheat-based products, particularly in relation to substitutes, may have spurred consumption. The introduction of new wheat products also appears to be aiding the recovery. A return to home baking, which is akin to the home canning boom, benefited the family flour

sector last year and the trend appears to be holding up well in 1975/76.

However, a word of caution: The lack of data on changes in flour inventories throughout the distribution system creates a major problem in the analysis of mill grind and consumption of wheat food products for any particular year.

Although the demand for grain for livestock feeds has expanded during 1975/76, wheat has generally not been competitively priced with feed grains. Some wheat was fed or bought for later feeding last summer when the wheat-feed grain price spread was narrowest (table 11). However, the post-harvest strength in wheat prices soon removed it from the feeding arena. In some areas, wheat is grown specifically for feed and in other areas, spot shortages of feed grains may have prompted additional wheat feeding from post-harvest supplies. But in general, the level and changes in the wheat feeding residual estimate after the July-September quarter probably represent changes in the residual characteristic of the feeding estimate as much as wheat feeding.

Exports during July-March totaled 937 million bushels, 16 percent ahead of last year's pace and the second largest for this period. Commercial shipments continued to dominate, accounting for over

Wheat: Supply and disappearance, July-March

Item	1974/75	1975/76
	<i>Million bushels</i>	<i>Million bushels</i>
July 1 stocks	247	327
Production	1,796	2,134
Imports	2	2
Total supply	2,045	2,463
Food	393	428
Seed	67	68
Feed	116	92
Exports	807	937
Total disappearance	1,383	1,525
April 1 stocks	662	938

90 percent of the total grain inspected for export during July-March. PL-480 shipments for this period of around 55 million bushels were only about a third of the projected movement.

April 1 Wheat Stocks Up Sharply

Wheat stocks on April 1 totaled 938 million bushels, 42 percent above a year earlier and the largest for that date since the spring of 1972. Both

farm and off-farm stocks continued to climb, reflecting the pressures of this year's larger supplies. Kansas and North Dakota, the major hard red winter and hard red spring States, respectively, accounted for nearly 40 percent of the total.

There is little question about the adequacy of this year's supplies. Disappearance during the April-June period is currently forecast at around 395 million bushels. April 1 stocks were more than double this level and off-farm stocks alone were over 50 percent larger than anticipated April-June needs. Thus, it seems unlikely that the marketplace would have any problems meeting its wheat requirements for the period. No major surprises are predicted for use during the last quarter. Mill grind normally weakens late in the crop year and 1975/76 should be no exception. Little if any old crop wheat will be fed as wheat prices in almost all areas are above feed grain prices. In fact, the wheat feed and residual estimate for April-June has been estimated at a "negative" 7 million bushels.

This highlights the residual nature of the feeding estimate. In recent years, this estimate has shown substantial fluctuations from quarter to quarter. In each of the past 3 years, it has been "negative" in at least 1 of the 4 crop year quarters (table 7). Most wheat feeding takes place during

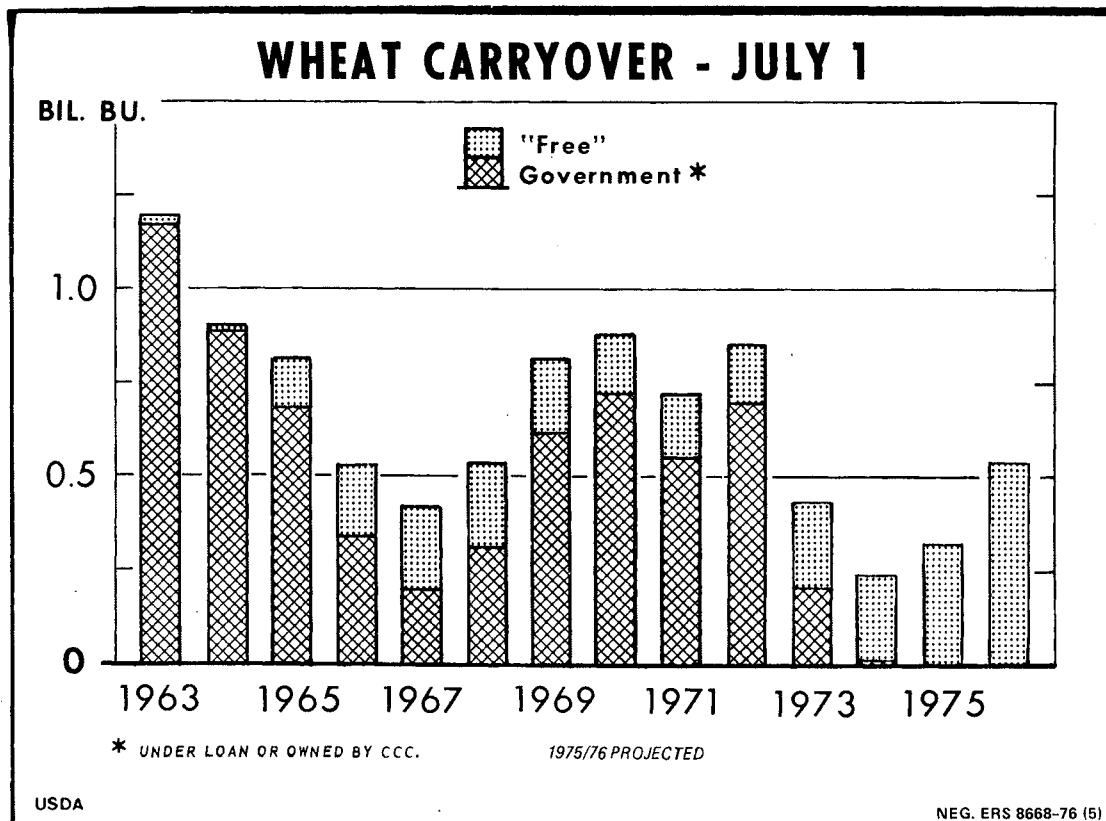

the July-September quarter. Consequently, with only limited wheat feeding in the remaining 3 quarters, even a small statistical discrepancy in another disappearance estimate or in a stock estimate can cause wide swings in the wheat feed residual.¹ However, annual estimates of wheat feeding are probably fairly good indicators of year-to-year changes and are valuable for assessing the long-term trend in feeding.

Balance Sheet Revisions Show Exports Down and Carryover Up

A number of changes have been made in the wheat supply-use balance sheet for 1975/76 since the February *Wheat Situation*. Flour mills have been operating at a heavy pace so far this year, and even with some easing in mill grind expected during April-June, the annual domestic food use could climb to 540 million bushels, nearly 3 percent ahead of last year's pace and one of the sharpest year-to-year changes on record.

Seed use has been increased slightly to reflect the expansion in spring wheat acreage. The wheat

¹For a more complete discussion of the feed residual see the May 1975 issue of the *Wheat Situation*.

feed residual has been estimated at 85 million bushels compared with 62 million for 1974/75. Wheat fed on farms where grown at 38 million bushels was about 15 percent greater than in 1974/75 and supports this year's larger wheat feed use. In the February *Wheat Situation*, it was pointed out that the attainment of the 1.3-1.4 billion export estimate was contingent on a number of factors, two of which were additional large grain sales to the USSR and a sharp pickup in shipments of PL-480 wheat. These contingencies did not materialize. Consequently, exports have been estimated at 1.2 billion bushels, off 100-200 million from earlier estimates but still the largest on record.

By early May slightly over one billion bushels of wheat and flour had been shipped. More than 100 million bushels were on the sales books but some additional sales are needed if the 1.2 billion is to be reached and many countries are now shifting their export purchases to the new crop season.

Disappearance for the 1975/76 crop year will total around 1.9 billion bushels, second largest of record. However, it will still fall short of last year's record 2.1-billion-bushel crop. Thus, around 200 million bushels will be added to stocks, bringing the total on July 1 to around 550 million or roughly two-thirds above a year ago.

Wheat Prices Ease After Rebound

On the strength of large grain sales to the USSR, wheat prices to U.S. farmers during July-September rose about 40 percent from their harvesttime lows of \$3.00 per bushel. However, a number of factors combined to sap the market strength during the October-December quarter. The absence of any news on new grain sales to the USSR, along with the flood of a record corn harvest, put downward pressure on grain prices. In addition, signs were indicating that even with record wheat exports projected, 1975/76 would be a year of stock building. These factors were overshadowed in January-March as concern heightened about drought-related damage to the winter wheat crop, and prices added about 15 percent. An early April crop production estimate for the most seriously drought-affected States suggested that the crop had deteriorated since December but that the extent of damage had been exaggerated by many. April showers across the heart of the wheat belt, including the drought-afflicted area, brought welcome relief. This was reflected in the May winter wheat estimate. Consequently, prices at most markets eased and in mid-April farm prices averaged \$3.50 per bushel.

The factors affecting old crop prices until demand shifts to new crop wheat will include:

1. The balance between old crop supplies and demand. Remaining stocks are more than adequate

Wheat prices received by farmers, 1975/76¹

Month	Price	Month	Price
	<i>Dollars per bushel</i>		<i>Dollars per bushel</i>
July	3.33	January	3.43

November	3.58	May	
December	3.41	June	
		Season average ..	3.52

¹ Mid-month.

to meet demand with substantial amounts left for adding to year-ending carryover. Current futures contracts reflect carrying charges which should encourage the nonfarm sector to carry their share of the inventory. Much of the farm-stored wheat is located in the Central and Northern Plains, a region which has traditionally stored large quantities of wheat on farm year after year. The availability of these stocks will depend upon farmers' holding patterns and their market expectations. These factors seem to indicate that there will be no significant pressures to sell before the advent of new crop supplies.

2. New crop developments. News of drought, rains, freezes, and disease will not only affect new crop quotes but will also have an impact on old crop prices. In early May prospects for the 1976 wheat harvest appeared good in almost every wheat-producing region. The second largest crop on record seems virtually assured. Consequently, supplies in 1976/77 will be the largest since the early 1960's. This is virtually the same story that was being told just 1 year ago. As the 1975 harvest approached, the market focused on the prospects that the 1975 crop would exceed demand and a buildup in stocks was likely. The market weakened, dropping nearly 75 cents during the April-June quarter.

If the 1976 crop develops as expected and another year of stock building seems imminent, farm prices could drift lower, possibly losing 25-50 cents per bushel between mid-April and the main harvesting period.

3. Current indications point to a larger world wheat crop in 1976/77. If problems develop in any of the major wheat exporting or importing nations, the expected decline in U.S. wheat prices could be reversed. However, if the world wheat crop appears to be progressing nicely, harvesttime prices could approach the lows of a year ago.

Season Average Price Lower

Farmers are expected to sell slightly over 2.0 billion bushels of wheat during 1975/76. A recent

SRS report, *Field Crops Production, Farm Use, Sales and Value*, estimated that farmers would receive on the average around \$3.50 per bushel for this wheat, 57 cents less than a year ago. Despite the dip in prices, value of sales for the 1975 crop will rise 3 percent to a record \$7.2 billion (table 19). This would be the fourth consecutive record return to wheat producers. However, costs of producing wheat have also risen sharply during much of this same period.

Bread Prices Down From Last Year

After rising to 35.5 cents per 1-pound loaf in January 1976, bread prices edged down over the rest of the quarter to 35.2 cents in March. For the first quarter of 1976 prices averaged 35.3 cents, one-tenth of a cent above the preceding quarter but 2 cents less than the first quarter of 1975. The change from October-December 1975 reflects a gain in the baker-wholesaler spread which is consistent with the record earnings reported by the baking industry. Costs of all ingredients to the baker were

virtually unchanged. The farm value of ingredients changed little for the quarter as a whole, although prices moved considerably within the quarter.

Year-to-year changes show a slightly narrower farm-retail spread. This is a reflection of lower retail prices, lower farm prices, a sharply lower retail spread and a sharply higher baker-wholesaler spread. The retail spread narrowed from 5.6 cents to 3.6 cents while the baker-wholesaler spread increased from 20.7 cents to 22.3 cents.

With farm ingredient prices stable or, in some cases, declining, changes in bread prices may remain fairly small in the next few months. However, as the economy continues to expand, higher input costs may cause spreads to increase. Spreads are not necessarily indicators of profits; increases in them may also reflect higher costs of labor, transportation, packaging, and other operating and overhead expenses of firms along the path from farm to market. Increases in spreads could more than offset declines in farm prices and cause bread prices to rise. The long-term trend of rising farm-retail spreads was interrupted in 1973 and 1974, but has now returned.

WHEAT BY CLASS

Estimates of the supply and disappearance by class for 1974/75 and 1975/76 have been updated to reflect recent revisions in production and stocks (table 6).

Hard Red Winter Stocks Up Sharply

April 1 stocks of Hard Red Winter (HRW) totaled around 500 million bushels, roughly 50 percent larger than a year ago. Kansas accounted for 40 percent of the total and the other five major producing States accounted for another 40 percent.

Disappearance during April-June will continue moderately heavy with exports again accounting for the bulk of the total. With April stocks more than triple anticipated use, there should be no supply problems for the remainder of the year. In addition harvest of the 1976 crop has already started.

For the entire marketing year disappearance of HRW will total almost 900 million bushels, about 7 percent more than a year ago. Domestic use is running slightly below a year ago as larger supplies of other wheat classes and the lower quality of last year's HRW crop may have cut back on HRW mill grind.

HRW exports are currently projected at 590 million bushels, up from a year ago but well below earlier projections. Through March around 470 million bushels of HRW wheat and equivalent wheat products had been shipped. By early May additional exports and sales commitments had pushed the total to around 550 million bushels. However, some additional sales will have to be made if the export projection is to be reached. Even then disappearance in 1975/76 will fall well short of the 1975 crop. Consequently, stocks this summer will more than double, rising to around 350 million bushels.

On the strength of export speculation, prices of No. 1 HRW at Kansas City topped out at just over \$4.00 per bushel during July-September. Prices faded until late winter when the crop scare in the Southern Plains buoyed the wheat market. Prices rose to \$4.00 in February but then retreated to below the \$3.50-level by early May.

HRW crop prospects for 1976 have had their ups and downs. The December report on planted acreage for winter wheat pointed to about 3 percent more HRW acreage. Conditions at that time suggested that the crop could fall around 100 to 150 million bushels short of the 1975 harvest. However, in the intervening period continued dry weather modified crop prospects in the Southern Plains, although apparently not as much as some had thought before the drought was broken. On April 9, SRS released an estimate of production in the five

most seriously affected States (New Mexico, Texas, Oklahoma, Kansas, and Colorado), which showed a reduction of only about 50 million bushels from the December estimate. After heavy rains swept through much of the HRW Belt this spring, crop prospects brightened. By early May conditions in many areas had improved and a crop of 850-900 million bushels seems possible or about a 15 percent smaller crop than a year ago. However, stocks of HRW are expected to be sharply larger this summer, offsetting the smaller crop.

Soft Red Winter Exports Heavy

Stocks of Soft Red Winter (SRW) totaled about 90 million bushels on April 1, nearly double their year-earlier level. The bulk of this was located in the major North Central SRW producing States. Farm stocks in the SRW producing States are relatively small, suggesting that much of this year's crop has moved out of farmers' hands. The pressures to clear out farm storage for other commodities last fall and winter pushed substantial amounts of SRW into the Chicago and Toledo terminal markets.

Demand during April-June will continue quite heavy. Domestic use will be buoyed by continued heavy mill grind. With SRW still the cheapest wheat at many export points, export sales should continue strong for this class.

For the marketing year, SRW disappearance may total an astounding 335 million bushels, almost 20 percent more than last year. Mill grind has been heavy throughout the SRW producing area because of two factors: (1) After a disastrous 1974/75 year when consumers cut back purchases of bakery products in response to sharply rising prices, sellers of soft-wheat-based products saw a significant rise in sales during calendar 1975. Family flour, a major user of soft wheat in the East, continued its strong showing. (2) Abundant SRW supplies resulted in significant price discounts compared with other classes. Apparently, SRW has been used in larger proportions in flour blends. Feeding of SRW was somewhat heavier because of the low prices early last summer.

Heavy exports to date reflect the fact that many countries will buy as much wheat as possible, given expenditure outlays, and that SRW has been the cheapest wheat at dockside. For the crop year SRW exports are expected to total around 170 million bushels, highest on record. Through March around 130 million bushels had been inspected. Since then another 10 million bushels have been shipped and as of May 2 outstanding sales reports showed 20 million. This brought total commit-

ments near the annual export estimate. Even if use attains this heavy level, 1975/76's record supply is overwhelming and stocks this summer could increase to around 25 million bushels.

Chicago soft wheat prices added about a dollar to their harvesttime lows during last fall's price move, but much of this gain was wiped out in the subsequent decline. Speculative pressures pushed up SRW prices during the late winter drought-based price bulge. However, prices have weakened recently and by early May were within 10 percent of their seasonal lows set last summer.

Acreage seeded to SRW last fall continued large and conditions to date point to average yield prospects. Unless problems develop in the near-term, the 1976 SRW crop should approach last year's bumper harvest. With beginning year stocks likely to be up, 1976/77 supplies could establish a new record high. Prospects for another large crop point to some additional weakness in SRW prices between now and the height of harvest, with the low point possibly near last summer's level of around \$3.00 per bushel.

Hard Red Spring Exports Heavy

April 1 stocks of Hard Red Spring (HRS) totaled around 180 million bushels, about a third more than a year ago. North Dakota accounted for nearly half of the total. Heavy farm stocks in the traditional HRS producing area suggest farmers still own a majority of current supplies.

Disappearance during the April-June period will continue heavy. Domestic use will be supported by continued heavy mill grind as prices of HRS have eased, making it more competitive with winter wheat. Seed use will be up this year, reflecting the largest spring wheat acreage since 1953. Export shipments will continue heavy reflecting the tight world supplies of protein wheat this year.

For the crop year, total use of HRS may register nearly a 15-percent increase from 1974/75. Domestic use of around 160 million bushels will be up slightly on the strength of heavier mill grind. Exports are currently projected at 165 million bushels, a fourth above a year ago. Through March less than 125 million bushels had been shipped. Recent sales and shipments have pushed total commitments to near the annual export estimate. Total use is expected to fall short of the 1975 harvest, causing some increase in stocks from last summer's level of 80 million bushels.

Mirroring the price movements of the other classes, Dark Northern Spring (DNS) at Minneapolis added close to 15 percent to prices between the June lows and late summer highs. Prices subsequently weakened and even during the height of the concern about 1976 prospects in the

Southern Plains, prices registered only a small gain. In early May, spring wheats at major markets were trading below last summer's lows, in sharp contrast to the winter wheats which were higher. This apparently reflects the current balance between supply and demand plus prospects for next year's crop. If 1976 crop prospects are realized, Dark Northern Spring could experience some additional price weakness, although the futures market is currently suggesting somewhat stronger prices by next fall.

Somewhat less protein in last year's HRW wheat crop and a below-average quality HRS crop set the stage for a strong protein wheat market this year. Spring wheats of higher protein have been commanding a dollar or more over ordinary, while higher protein winters have been 30-50 cents above ordinary HRW. In recent weeks the prospects for some improvement in supplies of higher protein wheats this next crop year have weakened protein premiums at most markets.

As of April 1, HRS producers indicated over 15 percent more planted acreage than for 1975. North Dakota, the largest producer, indicated 18 percent more, while Montana and South Dakota reported 27 percent and 7 percent more, respectively. A combination of better-than-expected prospects for HRW and continued price weakness for DNS may modify these plans. If yields are near normal, production from this acreage could approach 390 million bushels, nearly 20 percent above the 1975 harvest. With stocks also up, 1976/77 supplies would be substantially larger.

Durum Prices Continue Weak

Durum stocks as of April 1 totaled 71 million bushels, 44 percent above last year. Farm holdings accounted for 75 percent of the total. Stocks in North Dakota, which are now reported individually, accounted for four-fifths.

Disappearance during April-June is expected to continue reasonably heavy with exports slightly larger than domestic use. In recent years, sharply higher prices of competing foods set the stage for an increase in the consumption of pasta products. However, durum was left in the wings as upward spiraling durum prices caused pasta manufacturers to substitute hard wheat flour for semolina. In fact, 1974/75 consumption of pasta products was reported to be up significantly while durum grind fell. Weakening durum prices and lower quotes for semolina this year have apparently helped durum regain at least part of its traditional share of the U.S. pasta market. Seed use may fall somewhat short of last year's level as farmers indicate reduced plantings.

For the crop year, total use of durum is expected to climb to nearly 100 million bushels, second

heaviest on record. Domestic use could add about 10 percent, due to the increased mill grind.

The foreign market for U.S. durum has held up well as evidenced by the pace of this year's exports. Algeria continues to be our largest market, followed by the European Community and Eastern Europe. Through March over 40 million bushels had been inspected for export. By early May another 3 million bushels had been shipped but outstanding sales had slipped to 5 million. This does not include 5 million bushels reported as optional origin sales, however, additional sales are projected.

If the disappearance estimates prove correct, they would still fall short of the 1975 harvest. This would leave about 25 million bushels available for adding to stocks, pushing the total this July up to around 45 million.

Durum prices at Minneapolis have declined precipitously from the high levels of recent years and are currently trading near traditional levels. In early May, No. 1 Hard Amber Durum at Minneapolis was selling for about \$4.00 per bushel, over \$2.00 less than it commanded just 1 year ago. Prospects for a large buildup in stocks will keep durum prices under pressure for the remainder of the year.

Durum Wheat: Planted acreage, 1974-76

State	1974	1975	1976
	<i>1,000 acres</i>		
Minn.	86	105	115
Mont.	270	380	285
N. Dak.	3,600	4,080	3,670
S. Dak.	215	240	200
Sub total	4,171	4,805	4,270
Ariz.	N.A.	N.A.	325
Calif.	3	15	90
N. Mex.	N.A.	N.A.	20
U.S. total	4,174	4,820	4,705

N.A. - Not available.

As of April 1, durum producers indicated 1976 planted acreages of 4.7 million acres, 2 percent less than a year ago but 13 percent more than in 1974. Planting intentions in the traditional durum area of the Dakotas, Minnesota, and Montana was off sharply from a year ago. But most of this decline was offset by the expansion in acreage in Arizona, New Mexico, and California. If yields are near normal, the 1976 durum crop could fall in a range of

125-150 million bushels. With larger carryin stocks, 1976/77 supplies would be well ahead of this year's.

White Wheat Demand Heavy But Stocks Up

Stocks of white wheat on April 1 totaled around 95 million bushels, somewhat more than a year ago. About 70 percent of this was located in the Pacific Northwest. White wheat stocks in the East accounted for another 10-15 million bushels with the remainder scattered throughout the other western white wheat producing States.

Domestic use of white wheat in all areas during the 1975/76 crop year is expected to return to a more normal level of between 50-60 million bushels. High prices of white wheat relative to competing feedstuffs have limited feeding. There appears to be some general improvement in mill grind of white wheat both in the eastern market and in the Pacific Northwest. This reflects the overall improvement in the market for bakery products made from soft wheat flours.

Purchases by India have boosted export prospects this year to a projected 220 million bushels, a tenth above a year ago. Through March, inspections for export totaled nearly 170 million bushels. Shipments have been heavy in recent weeks, which would suggest that we could easily reach the 220-million level. If total use reaches the projected level, it would still leave about 10 million bushels of the 1975 crop for addition to stocks this summer.

White wheat markets have generally followed the path of the other winter wheats, more specifically HRW. This is at least partially explained by substitutability and by the fact that many of the current market transactions for white wheat in the PNW are priced, basis, HRW Kansas City.

In recent weeks, No. 1 white at Portland has sold at over \$3.50 per bushel. With some weakness expected for the other winter wheats it would seem quite likely that white wheat prices may also deteriorate.

Last fall white wheat producers seeded about 4 percent less acreage. There may be some increase in acreage seeded this spring, but total acreage will still be below last year. Growing conditions have been good and it seems quite likely that 1976 harvest could approach last year's 285 million bushels. The larger carryin stocks could result in supplies near or even above those for 1975/76.

WORLD WHEAT SITUATION¹

Less Wheat Harvested in 1975

A wrap-up of the 1975 world wheat crop shows a harvest of 344 million metric tons, down 2 percent from 1974. The poor crop in the USSR was principally responsible for the smaller harvest. World production, excluding the USSR, would be 278 million tons, 10 million tons larger than for 1974.

Argentina and Australia finished up the world's 1975 harvesting season with good crops. After a poor start, Australia experienced exceptionally favorable weather during the growing period and the 1975 wheat harvest is currently estimated at 12 million tons, up around 300,000 tons from 1974. Argentina's 1975 wheat harvest was well enough developed to escape a dry December. Production is estimated at 8.6 million tons, over 40 percent greater than 1974's and the third largest in 15 years.

World wheat exports for 1975/76 (July-June) are now estimated at 67 million tons of which the United States is expected to account for about 50 percent. Canada, Australia, and Argentina will account for about 40 percent.

Carryout Stocks Drop Again in 1975/76²

World carryout stocks for 1975/76 are estimated at 54 million tons, down 4 percent from 1974/75. Even though stocks in the United States are expected to be up 70 percent, the total for Canada, Australia, and Argentina, is expected to be the lowest in over 20 years.

Sizable Increase Projected for World 1976 Wheat Crop

Based on information relative to planting intentions and conditions of wheat crops around the world at the end of April, the 1976 world wheat crop is projected at 385 million tons, more than a tenth larger than last year.

It appears that the world's 1976/77 harvested area will rise significantly from last year. Most of this increase will be accounted for by Brazil, Canada, Australia, Argentina, and Western Europe. With the exception of Brazil, most of the increases stem from shifts into wheat from other field crops. A small decline in harvested area is expected in the United States and the USSR.

Eastern Europe . . .	31.5	34.1	29.1	32.6

¹Plus or minus 2.0 million. ²Based on USSR planned production of 205 million metric tons of total grains.

Conditions in Western Europe Improve

Favorable conditions for winter wheat prevailed over most of Western Europe until early April. In the European Community (EC) the area sown or intended to be sown to wheat is officially forecast at 11.3 million hectares. Winter wheat sowing was increased in Belgium, Denmark, and France by 56 percent, 29 percent, and 14 percent, respectively. Wheat production in the EC is expected to total 45.0 million tons, an increase of 18 percent over 1975. Western Europe's total production of wheat for 1976 is projected at 56 million tons, up 14 percent over 1975.

However, Northern Europe has experienced a protracted period of abnormally dry weather since early April, particularly in the Scandinavian countries, Northern Germany, the Netherlands, and the United Kingdom. This suggests that there could be some reduction in the current estimate for Western Europe's wheat crop.

Eastern Europe's 1976 Outlook Good

The condition of the wheat crops is much better over the whole region than a year ago, however, yield prospects are still uncertain. The area under wheat is about 4 percent larger than last year's low level. But there has been some deficit in soil moisture supplies since the planting season. East Europe's 1976 wheat production is projected at 33 million tons, up about a tenth from the depressed 1975 outturn.

Conditions Mixed in People's Republic of China (PRC)

There have been periods of scarce rainfall in the major wheat areas of the PRC. However, several offsetting factors are also at work: (1) heavy rains last fall and additional rains in March and April have provided near or above normal soil moisture

in the major winter wheat area, and (2) many of the drier areas are irrigated.

In Northeast China rainfall, while still inadequate, favored spring wheat, but the crop needs timely rains to overcome low soil moisture reserves. The PRC's 1976 wheat production is projected to reach last year's record level if weather in May is favorable.

Conditions in the USSR Improved Over 1975

The Soviet spring seeding plan as reflected in recent seeding progress reports suggests that roughly a fourth of the winter grain area seeded last fall is being resown to spring crops. Dry soils last fall apparently resulted in poor germination of the winter grain and the cold dry weather in early February probably caused somewhat heavier than normal winter damage. Spring sowing of small grains is progressing normally. As of May 17, around 64 million hectares had been sown, 64 percent of that planned.

Moisture conditions are reportedly above normal in the important Ukraine area, but remain significantly below par in the Volga region and the Western and Eastern Black Soil regions. However, while overall winter grain conditions currently are somewhat substandard, moisture conditions in the New Lands area, where spring wheat is produced, were comparatively favorable as of mid-April.

The official "plan" level for 1976 USSR grain production is about 205 million metric tons. Although a published breakdown is not available, this target is thought to include about 95 million of wheat, around 98 million of coarse grains (including millet), and 12 million of rice, pulses, and other items covered by the normal Soviet classification of grains. The 205 million tons, which is down some from the 1975-crop plan of 215 million, is believed to represent the outturn level which might be expected with "normal" weather.

Canada's Production Projected Larger

Under the Canadian wheat marketing system, farmers are paid an "initial" payment for their wheat when it goes into the elevators. Then, after the Wheat Board has sold the wheat for export, farmers are paid once again from the "pooled" funds from export revenues. On October 9, 1975, the Wheat Board revised the 1975 "initial" price of No. 1 CWRS wheat upward by \$1.50 (Canadian dollars) to \$3.75 a bushel.

Planting intentions as of mid-March showed all wheat for 1976 to be up 14 percent to 10.8 million hectares. Of this area, durum wheat would account for approximately 1.4 million hectares, a reduction of about 7 percent. Canada's 1976 production is projected at 18 million tons, up 6 percent over 1975. During March, it was reported that Saskatchewan and Manitoba were wetter than usual but rainfall was below normal in Alberta where dry conditions have prevailed.

India's 1976 Wheat Harvest Up 7 Percent

Very dry weather during January and February destroyed prospects for a 1976 wheat harvest which might have surpassed the record 1972 crop of 26.4 million tons. Even so, 1976 production is estimated at 25.5 million tons, up 5 percent over 1975. Much of the increase can be attributed to the larger planted area in high yielding varieties. Wheat imports for 1976/77 are projected at 6.8 million tons, compared to 7 million tons in 1975/76.

EC's 1976/77 Common Agricultural Policy (Grain)³

The EC will establish for the first time in 1976/77 a support price for utility wheat which is lower than the support price for bread wheat. Also, it will begin to narrow differences among the support prices for the various feed grains, with the aim of adopting a single support price for all feed grains in 1977/78. This means raising the support price for corn in relation to barley, as well as lowering the price of utility wheat. The objectives of these measures are to: (1) discourage utility wheat production, (2) stimulate corn production, and (3) encourage wheat feeding.

1976/77 World Wheat Exports To Be Down

World wheat exports for 1976/77 (July-June) are projected at 63 million tons, 4 million tons less than 1975/76. This will depend heavily upon the level of imports into the USSR. Tentatively, a decline of about 5 million tons in total USSR wheat imports is projected, with a total of only about 1 million tons offsetting gain in import volume for remaining areas of the world. Imports by the People's Republic of China are projected to remain unusually low for a second consecutive year.

The USSR has recently concluded grain purchases totaling 4.9 million tons of grain from the

³ERS, FAER No. 119, *The Agricultural Situation in Western Europe*, April 1976.

U.S.S.R.: Wheat Imports, 1972/73-1975/76

Year beginning July	Total from all sources	From United States
	<i>Million metric tons</i>	
1972/73	14.9	9.4
1973/74	4.4	2.7
1974/75	2.5	1.0
1975/76 (Preliminary) .	10.6	4.4

United States, 2.0 million tons of wheat from Canada and 1 million tons of wheat from Australia. The 4.9 million tons from the United States calls for 2.7 million tons of old-crop corn (delivery prior to September 1976), 1.65 million tons of new-crop corn (delivery after October 1, 1976), 423,000 tons of new-crop wheat (1976/77), and 127,000 tons for 1977/78.

International Wheat Agreement (IWA) of 1971 Extended to June 30, 1978

Secretary Butz has signed two protocols (April 5, 1976) providing for a 2-year extension of the Food Aid Convention and the Wheat Trade Convention that have been an integral part of the IWA since 1971.⁴

The Wheat Trade Convention provides for consultations among exporting and importing nations. Under the Food Aid Convention, the parties (collectively) are committed to provide a minimum of 4.2 million tons a year in food assistance to the developing nations, principally wheat and coarse grains. The IWA is administered by the International Wheat Council.

⁴The IWA of 1971 was initially for 3 years. It was extended for one year in 1974 and in 1975.

RYE HIGHLIGHTS

The rye situation continues slow at best. Through three quarters of the year, total utilization was running about 20 percent behind last year. Food use continues to lag well behind previous years as the unfavorable price relationship with wheat persists. Exports are extremely slow and will be the lowest since 1969. Feed use of rye is relatively strong, although it too is slower than last year. Seed use should also be down as acreage is expected to be smaller in 1976.

Rye: Supply and distribution

Item	July-March		
	1973/74	1974/75	1975/76
	Million bushels	Million bushels	Million bushels

¹ Totals may not add due to rounding.

The one bright spot on the rye horizon is industrial use by distillers. By March industrial use for 1975/76 had already surpassed that for all of 1974/75. This increase appears to be due to a recovery in the use of rye in distilled spirits—rye whiskey, bourbon, and blended whiskey—which had fallen off sharply in 1974/75. If the current pace is main-

Rye used in distilled spirits by months, 1973-76

Month	1973	1974	1975
	Bushels	Bushels	Bushels
July	148,818	48,876	65,448
August	152,197	55,713	71,902
September	147,594	113,498	169,227

February	228,783	122,634	160,294
March	231,817	130,086	
April	214,362	128,627	
May	210,368	157,986	
June	148,893	125,177	
Total	2,359,318	1,362,417	

tained, 1974/75's level will be exceeded by about a third or perhaps more.

Total supply for 1975/76 was also down by about 20 percent from 1974/75. This implies a further decline in stocks, possibly to their lowest level since 1947.

Rye prices are still holding well above their traditional levels although they are down slightly from last year's record highs. This year's season average farm price is estimated at around \$2.35 per bushel compared to last year's \$2.51.

1976 Prospects Good

Conditions of the 1976 crop are generally good and certainly much improved from a year ago when stands were spotty as a result of drought in the Northern Plains. Seedings last fall were off 4 percent and the smallest on record but the outlook for improved yields suggests that the harvest may be up substantially from last year's 18 million bushels.

MARKETING YEAR CHANGES

Beginning June 22, the USDA's Statistical Reporting Service will report grain and oilseed stocks as of June 1 instead of July 1. This change matches the new June 1 through May 31 wheat marketing year enacted by Congress in 1975. The previous marketing year for wheat was July 1 to June 30. Changing the start of the marketing year is consistent with the fact that the major thrust of harvest over the years had advanced to June.

Other Crops Included in Marketing Years Change

USDA has also shifted the marketing years for rye, oats, barley, and flaxseed to June/May because significant volumes of these crops also are harvested during June. Marketing years for corn and sorghum (October/September), soybeans (September/August), and rice (August/July) remain unchanged. Considerable sorghum is combined during July in south Texas, but because of the relative long harvesting period (July-November) and desires of the industry to have sorghum on the same basis as corn, it was decided to leave the sorghum marketing year unchanged.

U.S. grain stocks will be published for June 1, October 1, January 1, and April 1 beginning June 1976. Instead of the 4 usual calendar quarters, there will be 2 new intra-marketing year periods—June-September (4 mos.) and April-May (2 mos.).

Adjusting July 1 Stocks to June 1

In order to have a long-term series of supply and distribution information consistent with the new June-May marketing year, stocks of wheat and rye have been adjusted to June 1. The method used for wheat was to work from April 1 stocks as published, subtracting utilization during the months of April and May. In the supply-demand accounts, the volume fed to livestock and poultry in the period between stock releases (quarter) is calculated as a residual. (See page 5 of May 1975 issue of the *Wheat Situation*.) Monthly data for seed, mill grind, and exports are either directly reported or estimated.

Because the feed residual is derived quarterly and frequently is negative, there is a problem of allocating it on a monthly basis. After several approaches were taken, it appears that the simplest method is the best. That is taking a two-thirds of the total. Thus the accounting procedure developed to arrive at June 1 stocks entailed the following, with an example for 1975:

Item	Million Bushels
1) April 1, 1975 stocks	662
2) Plus April-May Imports	—
<hr/>	
3) Total Supply	662

5) June 1, 1975 stocks	430

The derived series based on the new marketing year and stock reporting changes are shown in tables 3 and 4. The authors of the *Wheat Situation* welcome comments and suggestions concerning these estimates and their methodology.

Flaxseed Marketing Year Changed

The marketing year for flaxseed is now June 1 through May 31, moved up from the former July-June year. Legislative changes in the wheat marketing year necessitated the change, since SRS will report grain and oilseed stocks as of June 1 instead of July 1.

Flaxseed supply and disposition data were developed for the year beginning June 1, 1960-1975 (table 5). The June 1 estimated stocks were derived from the July 1 reported stocks by adding back flaxseed crushed and exported during the month of June.

Soybean Stocks June 1

Beginning this June, stocks of soybeans in all positions will be reported as of June 1 since the July 1 stocks report has been discontinued. Hereafter, stocks of soybeans will be reported for January 1, April 1, June 1, and September 1.

Soybean stocks in all positions were estimated for June 1, 1960-75 (table 2). Estimates were added derived from the July 1 reported stocks by adding back soybeans crushed and exported during the month of June. We also analyzed the June 1 stocks position from the April 1 reported stocks (subtracting April-May soybean crushed, exported, and used for seed) and from the total marketing year supply (subtracting September-May reported usage). All three methods showed substantially the same stock level. No attempt has been made to breakdown June 1 estimated stocks between on farm and off farm holdings.

Table 2.--Soybean stocks in all position, January 1, April 1, June 1, and September 1, 1960-76

Year	January 1	April 1	June 1 <u>1/</u>	September 1 <u>2/</u>

1/ Includes "full-duty" wheat, wheat imported for feed, dutiable flour and macaroni and vermicelli products.

2/ Used for food in the United States and U.S. territories, and by the military both at home and abroad.

3/ Assumed to roughly approximate total amount used for feed, including amount used in mixed and processed feed.

4/ Includes grain, flour wholly from U.S. wheat and products in terms of grain, such as semolina, durum, macaroni, and noodles. Includes exports for relief or charity by individuals and private agencies and Bulgar and Rolled Wheat under Title II. Beginning 1961/62 adjusted for transshipments of U.S. wheat through Canada.

5/ Preliminary.

1/ Based on prices reported by Bureau of Labor Statistics. 2/ Spread between retail and wholesale prices. 3/ Estimated from BLS prices and trade data. 4/ Spread between wholesale price and cost to baker of all ingredients. 5/ Cost of flour plus shortening, nonfat dry milk, sugar and other minor nonfarm produced ingredients. 6/ Cost or sales value of flour (0.6329 lb.) used per pound of bread. 7/ Spread between mill sales value of flour and cost of wheat to miller. 8/ Cost of wheat (.01445 bu.), net of imputed cost of wheat chargeable to millfeed byproducts. 9/ Charges for transporting, handling, processing ingredients other than flour and cost of nonfarm produced ingredients such as yeast, salt, and malt extract. This spread is a residual figure. 10/ Returns to farmers for wheat, shortening, nonfat dry milk, and sugar used in a 1-pound loaf. 11/ Returns to farmers for wheat, net of imputed cost of wheat chargeable to millfeed byproducts. 12/ Based on monthly sales and prices of bread-type flour reported by a sample of flour milling firms. 13/ Weighted average for hard winter and spring wheat in the 10 major wheat producing States.

*Wheat and flour prices do not include allowance for marketing certificate since July 1, 1973, effective date of repeal.

Note: Price spreads may not add due to rounding.

Commodity Economics Division, ERS.

Table 21.--Summary of 1975 and 1976 feed grain and wheat program provisions

Item	1975	1976
Allotment (Mil. acres)		
Feed Grains	89.0	89.0
Wheat	53.5	61.6
Target Prices (Guaranteed payment made on production from allotment if 5-month weighted average market price falls below target)		
Corn (Dol. per bu.)	1.38	1.57
Sorghum " " "	1.31	1.49
Barley " " "	1.13	1.28
Oats " " "	0	0
Wheat " " "	2.05	2.29
Program Yields (For figuring farm production if target payments are required)		
Corn (Bu. per acre)	93.0	93.0
Sorghum " " "	60.0	55.0
Barley " " "	45.5	44.0
Wheat " " "	32.8	33.1
National Average Loan Rates (All U.S. production eligible)		
Corn (Dol. per bu.)	1.10	1.25
Sorghum " " "	1.05	1.19
Barley " " "	.90	1.02
Oats " " "	.54	.60
Wheat " " "	1.37	1.50
Rye " " "	.89	1.00
Loans:		
Application Period	Until March 31 for wheat, barley, and oats; May 31 for corn and sorghum.	Same as 1975
Maturity Dates		
Corn		
Sorghum		
Barley	On last day of 11th month following month in which loan was made or on demand.	Same as 1975
Oats		
Wheat		
Rye		
Interest Rates	6 1/8% per annum (subject to adjustment on October 1).	7 1/2% per annum for the period April 1, 1976 to March 31, 1977
Minimum CCC Resale Prices		
Corn (Dol. per bu.)	1.59	1.81
Sorghum " " "	1.51	1.71
Barley " " "	1.30	1.47
Oats " " "	.78	.87
Wheat " " "	2.36	2.63
Rye " " "	1.28	1.45
Other Major Provisions		
Soybean loan rate (Dol. per bu.)	None	2.50
Set-aside requirements	None	None
Conserving base requirement	None	None
Planting limitations	None	None
Disaster Payments	On allotment acreage: 1/3 of target price if prevented by weather from planting, or if production is 1/3 or more below normal.	Same as 1975
Maintaining Allotments	Planting of other crops may be used to preserve allotments.	Same as 1975
Payment Limitations	\$20,000 maximum per person; resource adjustment payments excluded.	Same as 1975

Stocks, ending: 6/					
World total	57.6	56.0	51.0	53.6	74.3

1/ Includes transshipments through Canadian ports; excludes products other than flour.

2/ Production data include all harvests occurring within the July-June year shown, except that small grain crops from the early harvesting Northern Hemisphere areas are "moved forward"; i.e., the May 1975 harvests in areas such as India, North Africa, and southern United States are actually included in "1976/77" accounting period which began July 1, 1976.

3/ "Bunker weight" basis: Not discounted for excess moisture and foreign material.

4/ Based on Soviet plan production of 205 million metric tons for total grains.

5/ Consumption data are based on an aggregate of differing local marketing years. For countries for which stocks data are not available (excluding the USSR) consumption estimates represent "apparent" consumption, i.e., they are inclusive of annual stock level adjustments.

6/ Stocks data are based on an aggregate of differing local marketing years and should not be construed as representing world stock levels at a fixed point in time. Stocks data are not available for all countries and exclude those such as the People's Republic of China and parts of Eastern Europe; the world stock levels have been adjusted for estimated year-to-year changes in USSR grain stocks, but do not purport to include the entire absolute level of USSR stocks.

1969/70	217.7	14.2	107.1	309.5	55.5	322.8
1970/71	206.0	15.2	93.8	313.7	56.3	335.2
1971/72	211.6	16.4	72.3	346.3	57.8	345.2
1972/73	209.0	16.3	73.4	339.7	72.2	361.2
1973/74	216.0	17.0	51.9	367.9	70.7	362.2
1974/75	219.8	15.9	57.6	352.0	68.7	353.6
1975/76 4/	224.2	15.3	56.0	343.8	75.0	346.2
1976/77 5/	227.3	16.9	53.6	384.8	66.5	364.1

1/ Data in this table are based on an aggregate of differing local marketing years, and will therefore differ from July-June data appearing elsewhere in this report.

2/ Stocks data are only for selected countries and exclude such important countries as USSR, the People's Republic of China, and part of Eastern Europe for which stocks data are not available; the aggregate stocks levels have, however, been adjusted for estimated year-to-year changes in USSR grain stocks.

3/ For countries for which stock data are not available, or for which no adjustments have been made for year-to-year changes, consumption estimates assume a constant stock level.

4/ Preliminary.

5/ Projected.

- 1/ Includes purchase agreements through the 1963 marketing year and direct purchases thereafter.
- 2/ Includes direct purchases and collateral acquired.
- 3/ Rye carryover refers to the end of the crop year.
- 4/ Old-crop under loan at end of crop year shown.
- 5/ Derived by subtracting CCC stocks and loans outstanding from total carryover.

Weights, Measures and Conversion Factors

Bushel weights:

Wheat & soybeans = 60 lbs.
Corn, sorghum & rye = 56 lbs.
Barley (grain) = 48 lbs.: malt = 34 lbs.
Oats = 32 lbs.

1,000 kilograms
36.7437 bushels wheat or soybeans
39.3679 bushels corn, sorghum, or rye
45.9296 bushels barley
68.8944 bushels oats

Bushels to metric tons:

Wheat & soybeans = bushels x .027216
Barley = bushels x .021772
Corn, sorghum, rye = bushels x .025400
Oats = bushels x .014515

Area:

1 Acre = .404694 hectares
1 Hectare = 2.4710 acres

1 Metric ton equals:

2204.622 lbs.
22.046 hundredweight
10 quintals

Yields:

Wheat = bushels per acre x 0.6725 = quintals per hectare
Rye, corn = bushels per acre x 0.6277 = quintals per hectare
Barley = bushels per acre x 0.5380 = quintals per hectare
Oats = bushels per acre x 0.3587 = quintals per hectare
